Aim: Write a program for implementing Method Overloading

Code:

```
public class MethodOverloading
{
    public static void main(String [] args)
    {
        System.out.println("The value of inches to centimeters is " +convertToCentimeters(10));
        System.out.println("The value of feet and inches to centimeter is
"+convertToCentimeters(12,18));
    }
    public static double convertToCentimeters(int xInches)
    {
        return 2.54*xInches;
    }
    public static double convertToCentimeters(int yFeet,int xInches)
    {
        double newInches= 12*yFeet;
        newInches +=xInches;
        return convertToCentimeters((int) newInches);
    }
}
```

Output:

The value of inches to centimeters is 25.4

The value of feet and inches to centimeter is 411.48
